1. View Personal Gacha Collection

- **API Endpoint**: localhost:8080/gacha/my_gacha_list

- **Flow**:

  - Player sends a GET request to the API Gateway at /my_gacha_list.

  - The API Gateway forwards the request to the Player microservice.

  - The Player microservice sends a GET request to the Players DB manager at /players/1.

  - The Players DB manager retrieves the player information from the Players DB and returns it to the Player microservice.

  - The Player microservice returns the gacha list to the API Gateway.

2. Access Details of Specific Gacha in Personal Collection

- **API Endpoint**: localhost:8080/gacha/1/1

- **Flow**:

  - Player sends a GET request to the API Gateway at /gacha/1/1.

  - The API Gateway forwards the request to the Player microservice.

  - The Player microservice sends a GET request to the Players DB manager at /players/1.

  - The Players DB manager retrieves the player information from the Players DB and returns it to the Player microservice.

  - The response contains the list of the player's gachas. If gacha 1 is in the list, the Player microservice sends a GET request to the Gacha microservice at /gachas/1.

  - The Gacha microservice retrieves the gacha 1 information from the Gachas DB and returns it to the Player microservice.

  - The Player microservice returns the gacha 1 information to the API Gateway.

3. Purchase In-Game Currency

- **API Endpoint**: localhost:8080/users/player/real_money_transaction

- **Flow**:

  - Player sends a POST request to the API Gateway at /real_money_transaction with the user ID and amount.

  - The API Gateway forwards the request to the Player microservice.

- The Player microservice sends a POST request to the Players DB manager at /update_balance/PLAYER with the user ID and amount.

- The Players DB manager updates the user's balance in the Players DB and returns a success response.

- The Player microservice sends a POST request to the Transactions microservice to record the transaction.

- The Transactions microservice records the transaction in the Transactions DB and returns a success response to the Player microservice.

- The Player microservice returns a success response to the API Gateway.

4. Set Up Auctions for Personal Gacha Items

- **API Endpoint**: localhost:8080/auctions/add

- **Flow**:

  - Player sends a POST request to the API Gateway at /auction/add with the gacha ID and auction details.

  - The API Gateway forwards the request to the Auction microservice.

  - The Auction microservice sends a GET request to the Gacha microservice to verify the gacha ownership.

  - The Gacha microservice verifies the ownership from the Gachas DB and returns the result to the Auction microservice.

  - The Auction microservice creates the auction in the Auctions DB and returns a success response to the API Gateway.
